SUMMARY

Senior Frontend Engineer with 6+ years architecting and shipping production web applications in React, TypeScript, and Next.js. Led the design of a microfrontend architecture using Module Federation that cut cross-team frontend conflicts by 40%, and raised a platform's Lighthouse performance score from 85 to 97 through targeted optimization work. Known for picking up new stacks fast — shipped production Svelte code within a single 3-month contract — and for mentoring engineering teams through code review, onboarding, and technical interviews. Combines hands-on engineering ownership with the technical judgment to lead architecture decisions end-to-end.

SKILLS

Core: React, TypeScript, JavaScript (ES6+), Next.js, React Query, Zustand, Context API, Redux, Redux-Saga, Svelte, React Native, REST APIs, GraphQL, HTML5

Styling: Tailwind CSS, shadcn/ui, SCSS/Sass, CSS Modules, Styled-Components, CSS3, Bootstrap, Ant Design, Material UI, Responsive Design, UI/UX Implementation

Architecture & Systems: Microfrontends, Module Federation, PWA, Frontend Architecture, Performance Optimization, Component-Based Architecture, Role-Based & Permission-Based Access Control (custom hooks and layout-level permission checks), Reusable Component Libraries, Scalable UI Systems

Testing: Jest, Vitest, React Testing Library, Playwright, TDD (Test-Driven Development)

Security & Authentication: OAuth2, OpenID Connect (OIDC)

Tools & Workflow: Git, GitHub, GitLab, Storybook, Figma, Sentry, Webpack, Vite, ESLint, Prettier, CI/CD, Jira

Methodologies: Agile, Scrum

AI-Assisted Development: Windsurf, Cursor

EXPERIENCE

Boxy (End-to-End Logistics SaaS Platform) UAE / Iraq

Senior Frontend Engineer Oct 2024 – Present

- Developed merchant-facing dashboards for an end-to-end logistics platform — real-time shipment tracking across 15+ order lifecycle flows, Mapbox-powered live maps, and Recharts visualizations, supporting 1,000+ orders processed daily.
- Implemented role-based access control (5 roles, 20+ permissions) through a custom usePermission hook and CheckPermission wrapper component, driving both logic and conditional UI rendering.
- Took ownership of a legacy bulk order import module, resolving 15+ critical issues and refactoring core logic to cut page load time by ~35%.
- Built 30+ reusable React Query hooks with shared caching, error handling, and performance tracing, integrated with Sentry error boundaries and session replay — cutting debugging time by ~25%.
- Raised the Lighthouse performance score from 85 to 97 through React Query caching, bundle optimization, lazy loading, and memoization.
- Led an incremental UI migration from Ant Design to shadcn/ui, converting pages one at a time — styled with Tailwind CSS — without pausing active feature work.
- Adopted Zustand for client-side state and built test coverage with Vitest, React Testing Library, and Playwright on a Vite-based setup.
- Maintained structured codebase documentation to give AI tools (Cursor, Windsurf) clear context — cutting token usage by ~21% and contributing to a ~30% reduction in sprint cycle time.
- Partnered with the mobile engineer on a React Native app, sharing React best practices and aligning reusable UI patterns across web and mobile.

Zynx Health (Healthcare Software) USA

Contract Frontend Engineer Jul 2024 – Sep 2024

- Built a dynamic, GraphQL-backed form builder for physicians in Svelte — a new framework picked up specifically for this 3-month contract — supporting multiple configurable field types including dropdowns, checkboxes, radio buttons, and text inputs.
- Wrapped Syncfusion components in a custom layer to provide a consistent UI API similar to Ant Design and MUI, working around Svelte compatibility limitations.
- Delivered reusable UI components — tested for accessibility — for a physician-facing healthcare tool within a tight 3-month contract.

Espad (Enterprise Platform) Iran

Senior Frontend Engineer Jul 2021 – Jun 2024

- Designed and implemented a microfrontend architecture using Module Federation and a pnpm-based monorepo, splitting the platform into independently deployable applications and cutting cross-team frontend conflicts by ~40%.
- Built a permission-based UI system — a custom hook and utility layer adopted across 50+ files — to control access and component visibility by role.
- Managed complex, asynchronous state, including multi-step API workflows, using Redux and Redux-Saga.
- Built an environment-aware gRPC debug panel with the tech lead, intercepting and logging API calls in dev/staging — cutting debugging time by ~30% by removing the need for manual console logging.
- Served as the team's go-to for code review and technical mentorship across 6 engineers, handling onboarding and participating in technical interviews.
- Implemented the frontend-side OAuth2/OIDC authentication flow (redirect-based authorization code), including JWT session handling, secure token storage, and identity-provider login redirects.
- Wrote unit and integration tests with Jest and React Testing Library, and end-to-end tests with Playwright, following TDD for core business logic; documented component behavior in Storybook.
- Delivered bi-monthly progress demos to the CEO and maintained developer guidelines to keep coding standards consistent across the team.
- Established SCSS Modules and BEM naming conventions, replacing inconsistent prior styling patterns and improving maintainability across the codebase.

Khishavere Iran

Frontend Engineer Aug 2019 – Jul 2021

- Built a PWA for a counseling platform with offline video playback (IndexedDB) and push notifications (Firebase), supporting an installable experience on mobile and desktop.
- Built the platform's marketing site in Next.js for SEO, alongside a React-based application panel.
- Delivered pixel-perfect UI implementations consistently praised by the design team.
